

Abstract

The invention provides means to enable stable operation rates of the industries which needs huge facilities.

The traders access to the server computer systems of trading service sites. The systems display input screens on the trades computer display devices. The traders input code information related to the manufacturing capacities, information of selling or buying, bidding prices, size information of manufacturing capacities to be traded, and periodic information of manufacturing capacities to be traded. The traders send these input information to the systems. The sent information is recorded as the transaction (bid) information in the trade information files of the systems. The systems make each trade by searching and judging the trade information files by referring code information among trade information to match conditions such as buying or selling, bidding prices, and periodic information.
